                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for treating an urological disorder which comprises assaying the ability of the compound to modulate 313, 333, 5464, 188717 or 33524 nucleic acid expression or polypeptide activity. The method is useful for identifying a compound for treating urological disorder comprising urinary incontinence e.g., overactive/oversensitive bladder, overflow urinary incontinence, stress urinary incontinence caused by defunction of the bladder, urethra or central/peripheral nervous system, prostatitis, benign prostatic hyperplasia, prostate cancer or kidney disorders. It is also used in gene therapy. The present sequence is human C-C chemokine receptor type 5 (CCBS; 333) protein. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                            Human; urological disorder; stress urinary incontinence; prostate cancer; beign prostatic hyperplasia; overactive bladder; oversensitive bladder; overselve urinary incontinence; gene therapy; nephrotropic; prostatitis; kidney disorder; C-C chemokine receptor type 5; CCR5; receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S

The invention relates to a method of producing an antibody, involving immunising an animal with a human G-protein chemokine receptor (HDGNRI0) polypeptide (also referred to as a human 7-transmembrane receptor) and recovering an antibody which binds the polypeptide. The method is useful for producing an antibody which binds specifically to the human G-protein chemokine receptor polypeptide. This sequence represents the HDGNRI0 polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                     Producing an antibody, involves immunizing an animal with a polypeptide or with a polypeptide encoded by the human G-protein chemokine receptor clone in ATCC 97183, and recovering the antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, chemokine receptor, CCR5, viral infection, surface protein, respiratory virus infection, respiratory syncytial virus infection, RSV infection, bronchiolitis, bronchitis, pneumonia, asthma.

                                                                                                                                                                                                                                                                                                                                    The present sequence represents human chemokine receptor CCR5. The specification describes a method for modulating viral infection of a cell. the method comprises modulating a binding interaction between a cell chemokine-receptor and a surface protein of the virus. The proviso is that the cell chemokine-receptor is not CX3CR1 and that the proviso is that the method is useful for treating or preventing respiratory virus infection in vertebrates, more particularly respiratory syncytial virus infections, and related diseases, e.g. bronchiolitis, bronchiolitis, pneumonia or asthma
                                                                                                                                                                                                                  Modulating viral infection of a cell, for treating or preventing respiratory virus infections, bronchitis, pneumonia or asthma, by modulating a binding interaction between a cell chemokine-receptor and surface protein of the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino acids. Also described: (I) an assay for the detection of a particular Gradies and assay for the detection of a particular Gradies and antibody having high specificity and high affinity or avidity for a particular GPCR. (I) can be used as GPCR modulators and in antibody against a particular GPCR, and in the production of specific antibody against a particular GPCR, and in the production of specific antibody against a particular GPCR, and in the production of specific antibody against a particular GPCR, and in the production of specific antibodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRS. The antigenic peptides for treating immune-related disease, immunological-related diseases, coll corresponding GPCRS. The antigenic peptides for treating immune-related diseases, immunological-related cell proliferative diseases or autoinmune diseases, eg. ALDS, Alzheimer's disease, contending and acute inflammation, allergies, Crohm's disease, parkinson's disease, multiple sclerosis, pain, psoriasis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohm's disease, pain, psoriasis, concernential, the schman, tuberculosis, obesity, nausea, hyperension, renal disorders, rheumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be used in immunoassaye and immunodiagnosis. ABB42252 to ABB42869 encode GPCR proteins given in ABP81675 to ABB42252 to ABB42869 encode cemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 receptor; human; anti-HIV; virucide; HIV; SIV; 88-CB; chemokine receptor; envelope protein; atherosclerosis; rheumatoid arthritis; tumour growth suppression; asthma; viral infection; AIDS; inflammatory condition.
                                                                                                                                       v isolated antigenic peptides e.g., for G protein-coupled receptors PCR), useful for diagnosing and designing drugs for treating conditions which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

The invention relates to screening for a modulator of human immunodeficiency virus (HIV) or simian immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV)
infection, comprising contacting a first composition having an human (ADC03341) or macaque (ADC03359) 88C chemokine receptor polypeptide with a second composition having an HIV or SIV envelope protein in the presence or absence or amound. Also included are screening for a modulator of HIV infection, detecting HIV infection of colls (comprising contacting a cell that has been recombinantly modified to express at least one of human chemokine receptors 88C and 88-28 with HIV, and detecting HIV infection of cells (comprising contacting cells with an antibody to at least one of human chemokine receptors 88C and 88-28 with HIV, and detecting HIV infection of the cell after the contacting step). The methods and compositions of the present invention are useful for the diagnosis and crivity of 88C or 88-28 chemokine receptors, such as atheroselerosis, rheumatoid arthritis, tumour growth suppression, asthma, viral infection, AIDS and other inflammatory conditions. The genes for human 88-C and 88-28 are located on chromosome 3921. The present sequence represents human chemokine receptor 88-C.
                                                                                                                                                                                                                                                                                                 Screening for a modulator of HIV and SIV infection utilizing polymucleotides that encode the 88C or 88-2B chemokine receptors, useful for diagnosing and treating disorders such as atherosclerosis, arthritis, AIDS and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                          Claim 2; Page 17-18; 29pp; English.

5 APPLICANT: LANDAU, NATHANIEL R.

6 TITLE OF INVENTION: MACROPHAGE-TROPHIC HIV, AND DIAGNOSTIC AND THERAPEUTIC

7 TITLE OF INVENTION: MACROPHAGE-TROPHIC HIV, AND DIAGNOSTIC AND THERAPEUTIC

7 TITLE OF INVENTION: USSS THEREOF

8 NUMBER OF SEQUENCES: 14

8 CORRESPONDENCE ADDRESS:

8 ADDRESSE: David A. Jackson, Esq.

8 TREET: #11 Hackensack Ave, Continental Plaza, #th
                   Sequence 13, Application US/09087232A
Patent No. 6153431
GENERAL INFORMATION:
TITLE OF INVENTION: HUMAN IMMUNOBFICIENCY VIRUS CO-RECEPTOR
TITLE OF INVENTION: VARIANTS ASSOCIATED WITH RESISTANCE TO VIRUS INFECTION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô

chemokine (C-C) receptor 1 - human

N.Alternate names: C-C CKR-1; macrophage inflammatory protein-1-alpha receptor

C.Species: Homo sapiens (man)

C.Species: Homo sapiens (man)

C.Species: Homo sapiens (man)

C.Accession: A45177; I55671

R.Neote, K.; DiGregorio, D.; Mak, J.Y.; Horuk, R.; Schall, T.J.

MESCATIAIC acetylcholine receptor, cardiac - pig

MINALternate names: muscarinic acetylcholine receptor M2

Gispecies: Sus scrofa domestica (domestic pig)

Gispecies: Sus scrofa domestica (domestic pig)

Gispecies: 15-Dec-1988 #sequence_revision 15-Dec-1988 #text_change 31-Dec-2000

Gispecies: A27386; A25656
